

Your Data, Your Dashboards

A friendly, no-code walkthrough of the Dynamic Dashboard app — how to upload your data and turn it into interactive charts you can explore just by clicking. No technical skills needed.

1 Welcome & the interface

2 Uploading your data

3 Building your first dashboard

4 Explore, drill down & everything you can do

This app turns your spreadsheets and data files into **interactive charts and dashboards — automatically**. You explore your data by clicking, not by writing formulas or code. In short: *upload a file → the app understands it → you pick what to see → you get charts you can click into*.

What you can do here

Upload any data
JSON, CSV & Excel — even messy, nested data.
No pre-formatting.

Auto-understanding
Detects your columns, types & nested lists — zero setup.

12 chart types
KPIs, bar, line, pie, radar, scatter, tables & more.

Drill down
Click any bar or slice to reveal the detail behind it.

Version safely
Re-upload anytime; duplicates ignored, changes tracked.

Save & share
Store, search, rename & present dashboards full-screen.

The workspace

The menu, explained

MENU ITEM	WHAT IT'S FOR
 Home	Your welcome page and most recent dashboards.
 Upload Data	Bring in a new data file (and optionally define a schema first).
 Uploaded Data	Browse everything you've uploaded, including nested sub-tables.
 Dashboard Builder	The workspace where you create charts and dashboards.
 My Dashboards	All your saved dashboards — search, rename, reopen.
 Settings	Account and preferences.

Getting your data in is the first step — and the app does the hard part of understanding it for you.

Step by step

- 1 Go to “Upload Data”**
Optionally upload a *schema* first — a small file describing your columns and which one is the unique key. This unlocks the smartest versioning.
- 2 Drag in your file**
Drop a JSON, CSV or Excel file onto the upload area (or click to browse). The app reads it right in your browser for a quick preview.
- 3 Review what it found**
See each column, its detected type, and sample rows. If you used a schema, any validation warnings appear here *before* anything is saved.
- 4 Confirm**
The app saves your data, automatically turning any nested lists into linked tables you can explore.

Re-uploading later? Versioning has you covered

WHEN YOU RE-UPLOAD...	WHAT HAPPENS
Exactly the same data	Recognised as a duplicate — nothing is doubled.
New records added	Appended to your current data automatically.
Existing records changed	Saved as a new version you can compare with the old one.
New columns added	Filled in across your data seamlessly.

Tip

A schema with a primary key lets the app tell a brand-new record apart from an updated one — keeping your history clean and comparable.

In the **Dashboard Builder** you pick the columns you care about and the app guides you to the right chart — you literally can't pick an invalid one.

- 1

Pick your columns
Choose up to four. As you select, the app highlights which charts make sense and greys out the rest.
- 2

Choose a chart
Pick from the recommended visuals — or accept the app's best-fit suggestion.
- 3

Shape it
Set how to summarise, filter, sort, and keep the Top 10. The chart updates live.
- 4

Add it to the canvas
Drop the tile onto your dashboard, then drag and resize it into place.

The chart types available

 **KPI**
A single big number.

 **Bar / Horizontal**
Compare categories.

 **Stacked Bar**
Parts within categories.

 **Line / Area**
Trends over time.

 **Pie / Donut**
Share of a whole.

 **Radar / Polar**
Compare many measures.

 **Scatter**
Two numbers related.

 **Table**
The raw rows.

 **+ more**
Always guided to valid picks.

Ways to shape your data

CONTROL	WHAT IT DOES
Summarise	Total, average, min, max, count.
Filter	Pick categories or a number range.
Sort	High-to-low or low-to-high.
Top / Bottom N	Keep just the top 10.
Style	Colours & legend position.
Compare	Overlay two data versions.

Live preview

 **You can't build a broken chart**

The app's compatibility engine only offers visuals that fit your selected columns, and recommends the best one — so every chart you make is valid by design.

A dashboard here isn't a static picture — it's interactive. Click into your charts, then save and revisit them anytime.

Drill down — click to go deeper

Click any bar, slice, table row or KPI and the app breaks it down by the **most useful next detail**, chosen for you automatically. A breadcrumb trail shows where you are so you can step back anytime.

Explore, save & manage

**Explore your tables**

Inspect any dataset and its nested sub-tables (e.g. orders and their line items), full-screen if needed.

**Arrange freely**

Drag tiles to move and pull a corner to resize — the layout snaps neatly into place.

**Save & find**

Name and save dashboards; search them from the top bar or browse in My Dashboards.

**Present full-screen**

Open a clean, full-screen preview — perfect for meetings.

Complete feature checklist

- ✓ Upload JSON, CSV & Excel
 - ✓ Nested data split into linked tables
 - ✓ Duplicate detection & versioning
 - ✓ Browse datasets & sub-tables
 - ✓ Best-chart recommendation
 - ✓ Colour & legend styling
 - ✓ Drag-and-drop resizable layout
 - ✓ Search & full-screen preview
- ✓ Automatic column & type detection
 - ✓ Optional schema & validation
 - ✓ Compare two versions on one chart
 - ✓ 12 chart types, guided selection
 - ✓ Summarise, filter, sort, Top-N
 - ✓ Click-to-drill-down + breadcrumbs
 - ✓ Save, rename & delete dashboards
 - ✓ Combine multiple datasets

Quick FAQ

QUESTION	ANSWER
Do I need SQL or code?	No — you point and click; the app does the rest.
My data has nested lists?	Fine — they're split into linked tables automatically.
How do I go back while drilling?	Click any step in the breadcrumb trail.
A screen won't load data?	The backend service/database may be offline — contact whoever set up the app.

**You're ready**

Start on **Upload Data**, bring in a file, then head to the **Dashboard Builder**, pick a few columns, accept the recommended chart, and click into it. You'll have an interactive dashboard in minutes.
